

# Informatique 1

## Introduction à la programmation

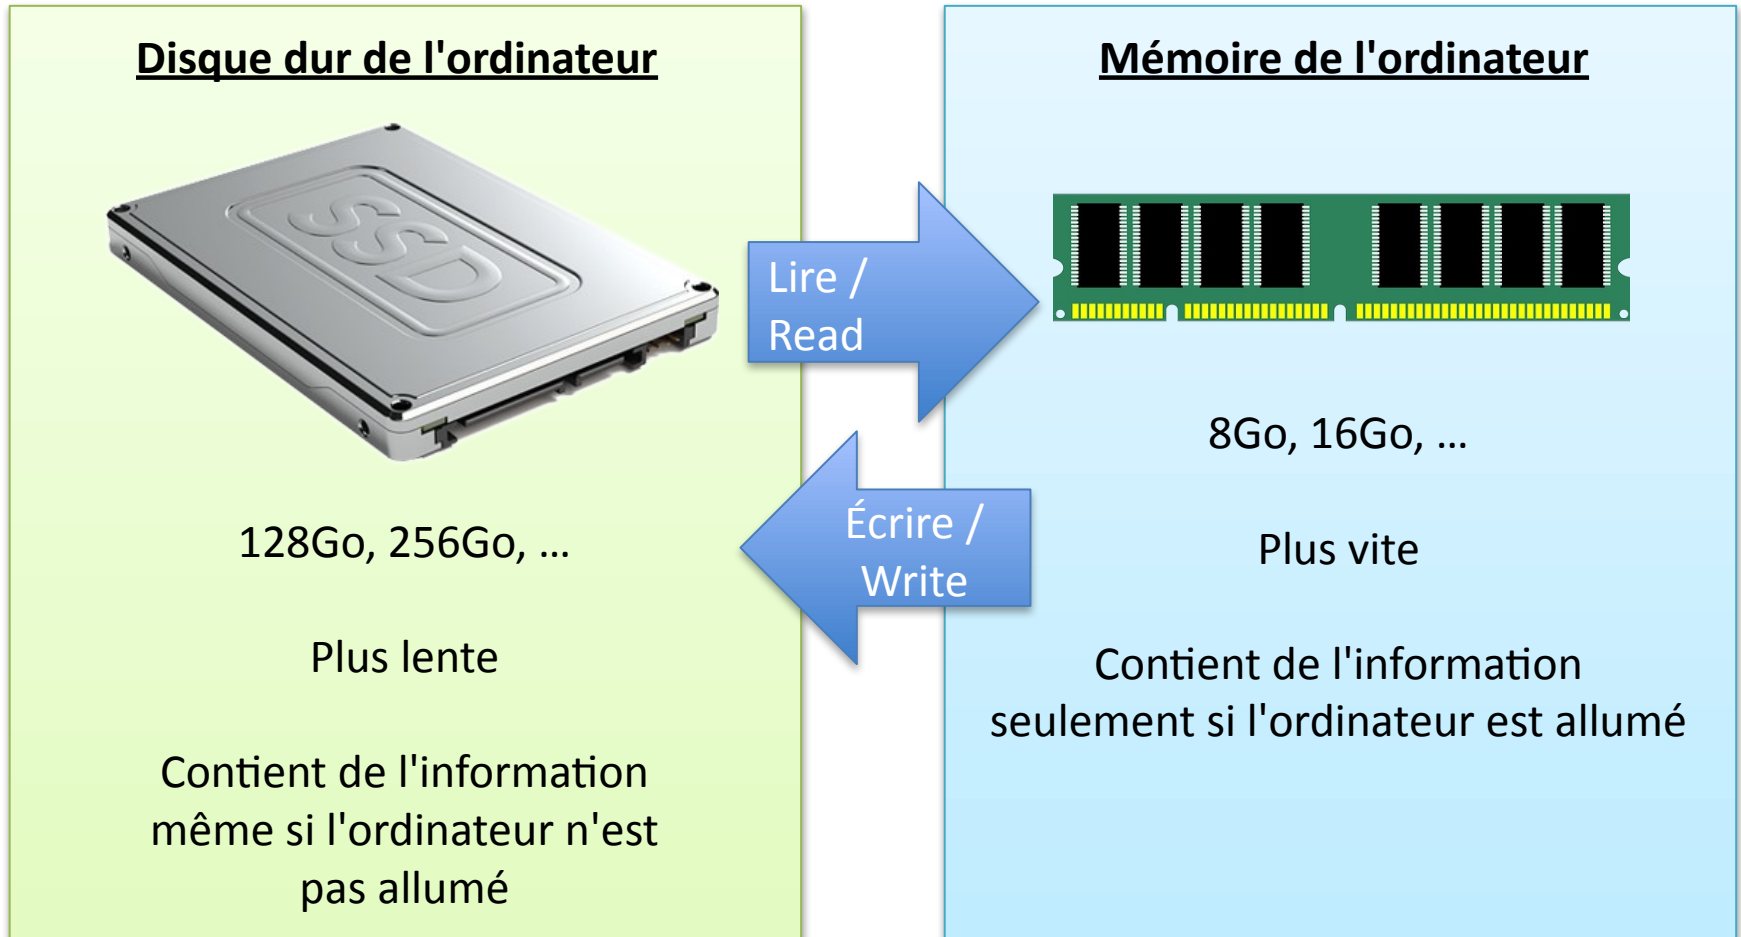

### Mission 6 : introduction

Kim Mens Siegfried Nijssen Charles Pecheur

# Mission 6

- Objectifs
  - fichiers
  - exceptions
- Problème
  - Création d'un outil dans lequel l'utilisateur peut donner des commandes; doit continuer même si l'utilisateur donne des mauvaises commandes

# Fichiers

# Méthodes sur Chaînes

- Des méthodes importantes sur chaînes de caractères dans le contexte de fichiers:
  - `split ( )`: séparer des champs

# Erreurs

- Qu'est-ce qui peut se passer à l'exécution de ce programme?

```
name = input ( "Provide a file name: " )  
file = open ( name, "r" )  
for line in file:  
    print(line)  
file.close ()
```

Provide a file name:

# Erreurs

- Qu'est-ce qui peut se passer à l'exécution de ce programme?

```
name = input ( "Provide a file name: " )  
file = open ( name, "r" )  
for line in file:  
    print(line)  
file.close ()
```

```
Provide a file name: nexistepas.txt
```

# Erreurs

- Qu'est-ce qui peut se passer à l'exécution de ce programme?

```
name = input ( "Provide a file name: " )  
file = open ( name, "r" )  
for line in file:  
    print(line)  
file.close ()
```

```
Provide a file name: nexistepas.txt  
Traceback (most recent call last):  
  File "test.py", line 2, in <module>  
    file = open ( name, "r" )  
FileNotFoundError: [Errno 2] No such  
file or directory: 'nexistepas.txt'
```

# Erreur

- Comment d'éviter que le programme s'arrête?

```
name = input ( "Provide a file name: " )  
try:  
    file = open ( name, "r" )  
    for line in file:  
        print(line)  
    file.close ()  
except:  
    print ( "Error reading file" )
```

# Gestion des Exceptions

- Python **lève** une **exception** s'il y a une erreur
- On peut **intercepter** des exceptions en utilisant un bloc `try ... except`

```
name = input ( "Provide a file name: " )
try:
    file = open ( name, "r" )
    for line in file:
        print(line)
    file.close ()
except:
    print ( "Error reading file" )
```

(1) Ouverture  
(2) Traitement  
(3) Fermeture  
(4) Exceptions

# Gestion des Exceptions

- Il y a beaucoup d'erreurs différentes possibles:
  - Fichier n'existe pas
  - Assert error
  - Division par zéro
  - Valeur incorrecte ( `int("Bonjour")` )
  - Index incorrect
- Toutes sont interceptées par **except**

# Gestion des Exceptions

- Deux erreurs sont possibles ici:

```
num = input ( "Provide a number: " )  
try:  
    print ( 1 / int(num) )  
except:  
    print ( "Error doing calculation" )
```

- Pour toutes les deux, le même message

# Gestion des Exceptions

- Intercepter des erreurs spécifiques :

```
num = input ( "Provide a number: " )  
try:  
    print ( 1 / int(num) )  
except ValueError:  
    print ( "No integer provided" )  
except ZeroDivisionError:  
    print ( "Division by zero" )
```

# Gestion des Exceptions

- Python montre des messages plus détaillés

```
Provide a file name: nexistepas.txt
Traceback (most recent call last):
  File "test.py", line 2, in <module>
    file = open ( name, "r" )
FileNotFoundError: [Errno 2] No such
file or directory: 'nexistepas.txt'
```

# Gestion des Exceptions

- Récupérer le message qui serait montré par Python même

```
num = input ( "Provide a number: " )  
try:  
    print ( 1 / int(num) )  
except ValueError as error:  
    print ( "ValueError: " + str ( error ) )  
except ZeroDivisionError:  
    print ( "Division by zero" )
```

```
Provide a number: age  
ValueError: invalid literal for int()  
with base 10: 'age'
```

# Gestion des Exceptions

- Lever des exceptions

```
try:  
    age = int(input( "Provide your age: " ))  
    if age < 0 or age >= 150:  
        raise ValueError ( "Age out of range" )  
    print ( "Your age is registered" )

File est automatiquement fermé si l'exécution sort du bloc 'with'.

Programme **ne demande plus** d'accès!!!

# Fichiers

## Approche recommandée

```
name = input ( "Provide a file name: " )
```

```
try:
```

```
with open( name, "r" ) as file:
```

```
    for line in file:  
        print(line)
```

```
except:
```

```
    print ( "Error reading file" )
```
